| <b>Description</b> <p>According to the conceptual and logical models, eposb:alias provides just an additional name for a borehole (together with time period and responsible party). The schema requires<br/>eposb:origin =&gt; responsible party<br/>eposb:aliasValidityPeriod =&gt; time period for the alias<br/>eposb:borehole =&gt; !!! It has to be left empty or filled with eposb:Borehole, i.e. borehole content. This is really weird, because we don't need it and it has no function in this context.</p> <p>The important information is given in the according to the data model required but according to the schema optional (probably due to gml)<br/>gml:name =&gt; the alias name<br/>gml:identifiant =&gt; points circular back at the borehole within the document</p> <p>eposb:borehole in eposb:alias has to be taken away or needs to be explained.</p> |         |                      |            |
